

REA-PEN PRO

Skin Natural Collagen Induction System

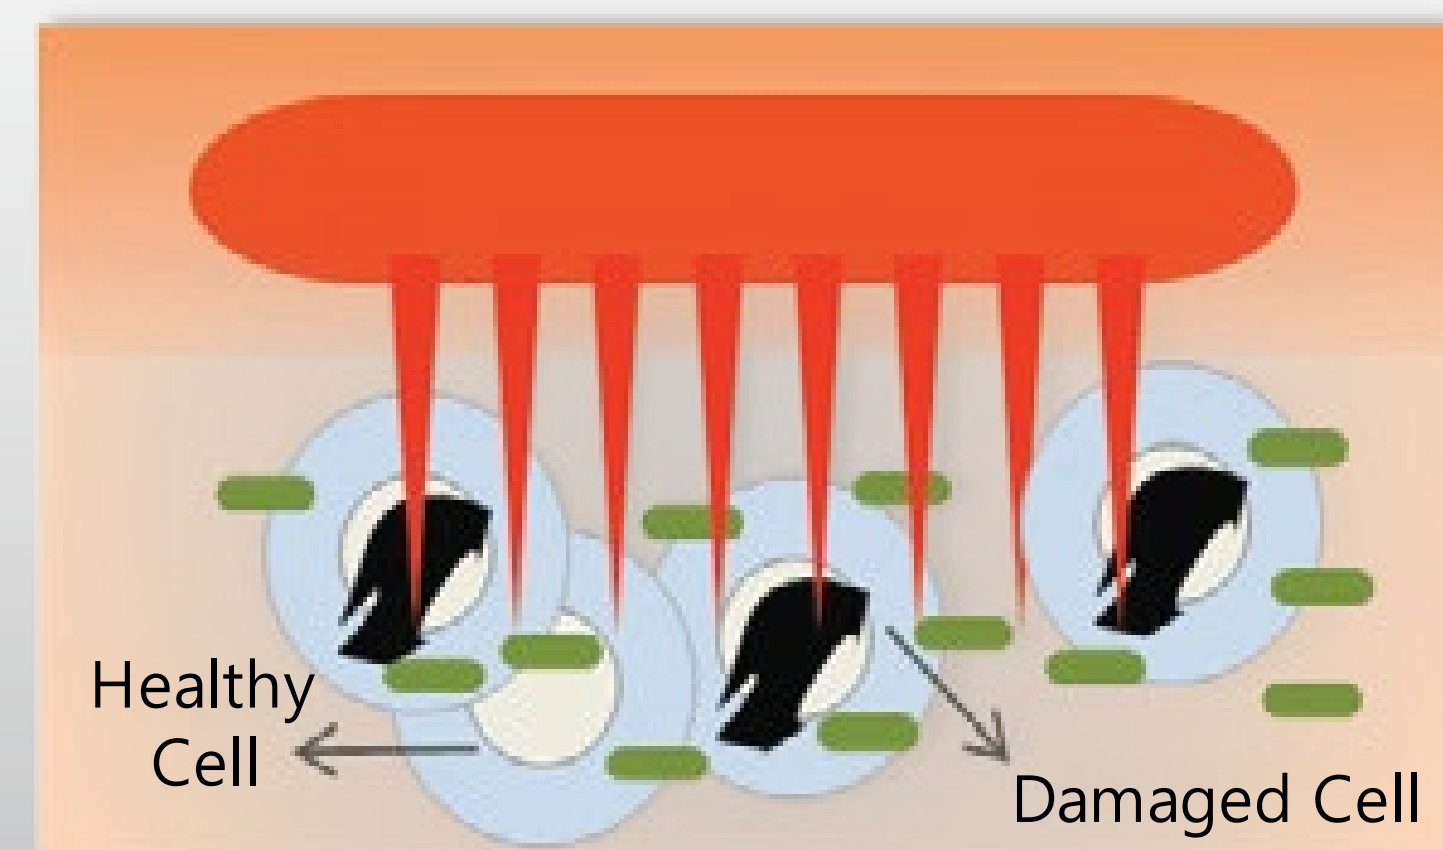

COLLAGEN INDUCED THERAPY *System*

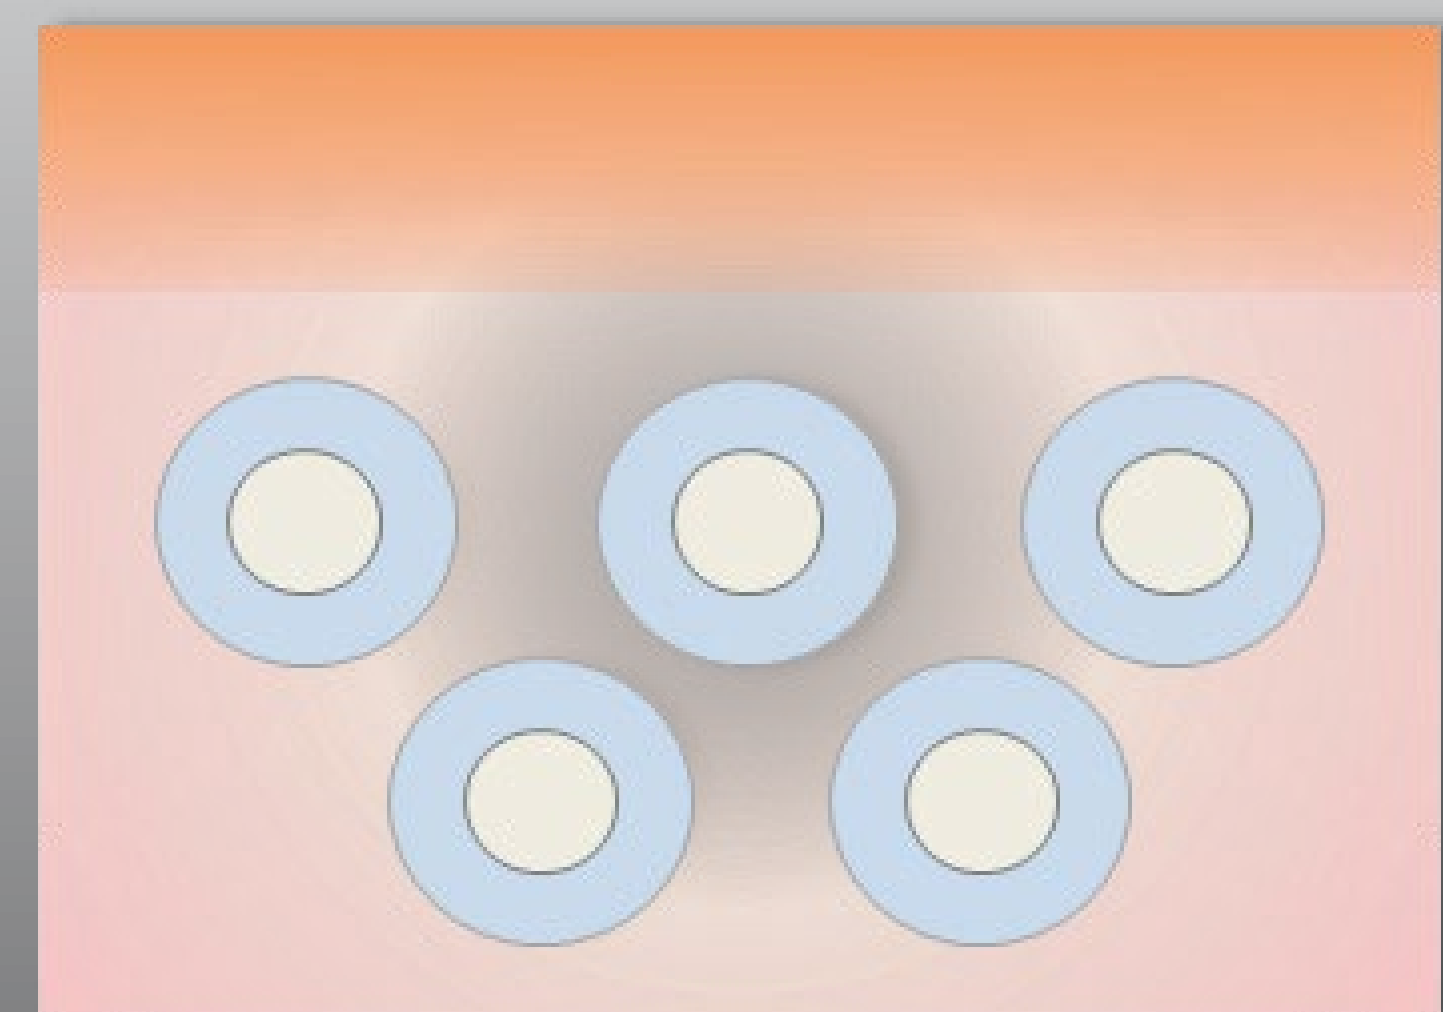

EPIDERMIS
DERMIS

As we age, our skin cells become aggravated, lost its functions, and the ability to regenerate also decrease. Main target of REA-PEN PRO micro-needling is to treat this imperfection. MICRO-NEEDLING technique creates tiny micro channels to the skin, facilitates CIT process, and allows product to penetrate deeper into the dermis layer.

EPIDERMIS
DERMIS

Micro channels created by the needle will be closed within hours, while the micro wounds inside create inflammation, sending signal to our body, supported by the product's active ingredients, healing process starts, produces more fibroblasts, induces collagen remodeling, promotes collagen production, creates more healthy cells, and repairs the damage cells.

EPIDERMIS
DERMIS

Normal regeneration process will take 14-28 days in healthy skin, which will be more and more delayed by aging, resulting dull skin & unhealthy skin. CIT repair the regeneration, push the cell regeneration into its normal cycle. Damage cells removed, more healthier cells creates, thickening the dermis layer. In results, it improves skin texture, pores, wrinkles, and other blemishes. Skin looks healthy and youthful.

INDICATIONS & BENEFITS

- Skin resurfacing
- Brightening
- Large pores reduction
- Lines & wrinkles improvement
- Improves skin texture
- Maintain turnover cells
- Skin regeneration
- Stretchmarks treatment
- Minimal downtime, fast healing
- Painless
